CS-322 Introduction to Database Systems
Project Deliverable #2
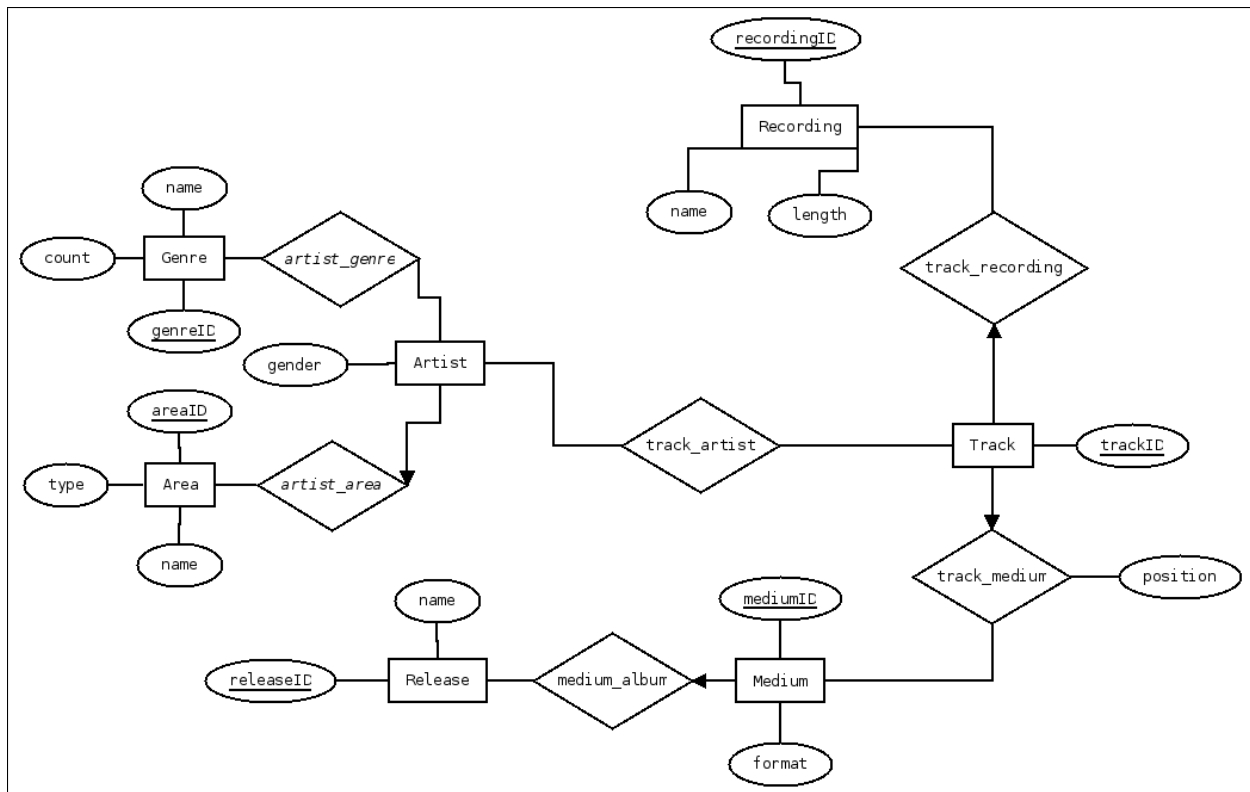

Due on Wednesday, May 7th, 2014

Group 24
Klay, Ameho, Vinh Mau

ER model for music database

SQL DDL code for table creations

```
   CREATE TABLE Areas (
     areaID INTEGER,
     name VARCHAR(500) NOT NULL,
     type VARCHAR(255),
5    PRIMARY KEY (areaID) ) ;

   CREATE TABLE Genres (
     genreID INTEGER,
     name VARCHAR(2000) NOT NULL,
10   count  INTEGER DEFAULT 0,
     PRIMARY KEY (genreID) ) ;

   CREATE TABLE Artists (
     artistID INTEGER,
15   name VARCHAR(2000) NOT NULL,
     areaID INTEGER,
     gender VARCHAR(255),
     type VARCHAR(255),
     PRIMARY KEY (artistID),
20   FOREIGN KEY (areaID) REFERENCES Areas ) ;

   CREATE TABLE Recordings (
```

```
      recordingID INTEGER,
25    name VARCHAR(4000) ,
      length INTEGER,
      PRIMARY KEY (recordingID) ) ;

30
CREATE TABLE Releases (
      releaseID INTEGER,
      name VARCHAR(2000) NOT NULL,
      PRIMARY KEY (releaseID) ) ;
35
CREATE TABLE Mediums (
      mediumID INTEGER,
      releaseID INTEGER,
      format VARCHAR(255),
40    PRIMARY KEY (mediumID),
      FOREIGN KEY (releaseID) REFERENCES Releases ) ;

CREATE TABLE Tracks (
45    trackID INTEGER,
      mediumID INTEGER,
      recordingID INTEGER,
      position INTEGER,
      PRIMARY KEY (trackID),
50    FOREIGN KEY (mediumID) REFERENCES Mediums,
      FOREIGN KEY (recordingID) REFERENCES Recordings ) ;
```

SQL script for entities table creation

```
CREATE TABLE Artist_genre (
      artistID INTEGER,
      genreID INTEGER,
      PRIMARY KEY (artistID, genreID),
5     FOREIGN KEY (artistID) REFERENCES Artists,
      FOREIGN KEY (genreID) REFERENCES Genres ) ;

CREATE TABLE Track_artist (
10    artistID INTEGER,
      trackID INTEGER,
      PRIMARY KEY (artistID, trackID),
      FOREIGN KEY (trackID) REFERENCES Tracks ,
      FOREIGN KEY (artistID) REFERENCES Artists ) ;
```

SQL script for relations table creation

Design choices & data constraints

There are three main concepts in our music database : **Song**, **Artist** and **Album**. Both Song and Album were divided between their descriptive data (**Recording, Release**) and their physical incarnation (**Track, Medium**). Since data is often incomplete, most of the entities 'can be related' but do not have to. We put a NOT NULL constraint on most of the name attributes of the entities, with the exception of **Recording** for the reason just stated. Since they are not required fields to describe music, they should have a valid name when they are in fact used.

- A **Track** is related to:

    Recording: A track can be a physical incarnation of a known recording.

    Artist: A track can exist without known artists, but can also have several artists to describe collaborations.

    Medium: A track can be recorded on some medium. Their relation is characterized by the track position on the medium.

- An **Artist** is defined by a:

    Genre: A genre can regroup multiple artists, whereas an artist can be difficult to define as catering to a specific genre, or crossing boundaries between genres nullifying the need for a constraint. We kept the count attribute, choosing small update costs over on-demand higher computation costs.

    Area: An artist's location can be pinpointed to a specific creation grounds, hence can be expressed by a foreign key constraint. But several artists can be compelled to share their musical feelings in the same studio.

- A **Release** is the logical aggregation of songs, labeled by a title, and can be recorded on multiple mediums. Conversely, a medium identifies a singular recording of an album, enforced by a foreign key constraint.

The integrity of the count attribute in **Genre**, are not guaranteed by the table creation. It will later be enforced later on by the import and delete data commands.

Design changes from deliverable 1

We removed all of our 'at least one' constraints to facilitate the import of new data. For the same reason, we also changed our model to be closer to the given data, so that one can easily add any information into the database and not just track-related information like we initially had in mind. That is, in our first model, everything had to be related to a track to be relevant but now every entities are independent.

About data import

We have not yet be able to import all data into the database. We tried using SQL loader to gain time but we ended up messing up our indexes and we pretty much had to empty all of our tables. This part of the assignment will be completed for the final deliverable. For this one, we worked with a few hundreds entries for each table.

SQL Queries

```sql
-- Print the names of artists from Switzerland, i.e.,
-- artists whose area is Switzerland.
-- You should not include the names of the artists associated
-- with individual cantons and towns in Switzerland.
SELECT     arti.name
FROM       artists arti, areas area
WHERE      arti.areaID=area.areaID AND area.name='Switzerland' ;
```

SQL script for query A

```sql
-- Print the names of areas with the highest number male artists,
-- female artists and groups.
-- For each of these 3 areas, print the number of artists of
-- each of the three types in the area.

-- Area with the most male Artists
Select  artistarea.areaname, artistarea.Type, count(*) "number" from
     (Select * from Artists arti INNER JOIN (
     SELECT    Area.name areaname, area.areaId
     FROM      Areas area
     WHERE     area.areaid = (
                         SELECT    AreaId areafemale
                         FROM (
                              SELECT    AreaId , count(*) c
                              FROM      Artists
                              WHERE     (gender = 'Male')
                              GROUP BY  AreaId
                              ORDER BY  c DESC
                         )
                         WHERE     ROWNUM <=1
     )
     ) toparea
     ON arti.areaid = toparea.areaid) artistarea
GROUP BY artistarea.Type , artistarea.areaname
;
-- Area with the most female  Artists
Select  artistarea.areaname, artistarea.Type, count(*) "number" from
     (Select * from Artists arti INNER JOIN (
     SELECT    Area.name areaname, area.areaId
     FROM      Areas area
     WHERE     area.areaid = (
                         SELECT    AreaId areafemale
                         FROM (
                              SELECT    AreaId , count(*) c
                              FROM      Artists
                              WHERE     (gender = 'Female')
                              GROUP BY  AreaId
                              ORDER BY  c DESC
                         )
                         WHERE     ROWNUM <=1
     )
```

```
            ) toparea
         ON arti.areaid = toparea.areaid) artistarea
     GROUP BY artistarea.Type , artistarea.areaname
45   ;
     -- Area with the most female Groups
     Select  artistarea.areaname, artistarea.Type, count(*) "number" from
            (Select * from Artists arti INNER JOIN (
         SELECT     Area.name areaname, area.areaId
50       FROM       Areas area
         WHERE      area.areaid = (
                               SELECT     AreaId areafemale
                               FROM (
                                     SELECT     AreaId , count(*) c
55                                   FROM       Artists
                                     WHERE      (gender = 'Female') and (type = 'Group')
                                     GROUP BY   AreaId
                                     ORDER BY   c DESC
                               )
60                             WHERE      ROWNUM <=1
            )
            ) toparea
         ON arti.areaid = toparea.areaid) artistarea
     GROUP BY artistarea.Type , artistarea.areaname
65   ;
```

SQL script for query B

```
     -- List the names of 10 groups with the most recorded tracks.
     SELECT    *
     FROM (
         SELECT     Name
5        FROM       Artists arti
         INNER JOIN (
                     SELECT     ArtistId
                     FROM (
                               SELECT ArtistId  , count(*) numb
10                             FROM       TRACK_ARTIST
                               GROUP BY  ArtistId
                               ORDER BY  numb DESC )
                ) artiId
         ON        arti.ArtistId = artiId.ArtistId
15       WHERE     arti.Type = "GROUP"
     )
     WHERE     ROWNUM <=10  ;
```

SQL script for query C

```
     -- List the names of 10 groups with the most releases.
     SELECT    name
     FROM      Artists arti
     INNER JOIN (
5            SELECT            ArtistId, COUNT(DISTINCT releaseId) num
             FROM              track_artist trackarti
```

```
         INNER JOIN  (
                  SELECT      *
                  FROM        Tracks track
10               INNER JOIN  (
                           SELECT        mediums.mediumid, mediums.releaseid
                           FROM          Mediums
                           INNER JOIN    Releases
                           ON            mediums.releaseid = releases.releaseid
15                     ) medi
                  ON    track.mediumid = medi.medium
            ) track
         ON        trackarti.trackid = track.trackid
         GROUP BY  ArtistId
20       ORDER BY  num DESC
      ) artiId
ON       arti.ArtistId = artiId.ArtistId
WHERE    ROWNUM <=10  ;
```

SQL script for query D

```
-- Print the name of a female artist associated with the most genres.
SELECT    name
FROM      Artists arti
INNER JOIN  (
5         SELECT        arti.artistid, COUNT(DISTINCT genre.genreid) numb
          FROM          Artists arti
          INNER JOIN    Artist_Genre genre
          ON            arti.artistId = genre.artistId
          WHERE         arti.gender = 'Female'
10        GROUP BY      arti.ArtistId
          ORDER BY      numb DESC
      ) artigenre
ON       arti.artistid = artigenre.artistid
WHERE    ROWNUM <=1  ;
```

SQL script for query E

```
-- List all cities which have more female than male artists.
SELECT     areamalefemale.topname
FROM (
      SELECT          city."NAME" topname , city.areaid,
5                     count(CASE WHEN arti.gender = 'Female' THEN 1 END) AS females,
                      count(CASE WHEN arti.gender = 'Male' THEN 1 END) AS males
      FROM            Artists arti
      INNER JOIN      Areas city
      ON              city.areaid = arti.areaId
10    WHERE           city.type = 'City'
      GROUP BY        city.areaId , city."NAME"
) areamalefemale
WHERE     areamalefemale.Females > areamalefemale.Males
```

SQL script for query F

```
-- List the mediums with the highest number of tracks.
SELECT    track.mediumid
FROM      Tracks track
GROUP BY  track.mediumid
HAVING    COUNT (*) >= ALL (
                              SELECT    COUNT(*)
                              FROM      Tracks track
                              GROUP BY  track.mediumid
                    )
```
